

## TPS40345 3-V to 20-V Input Synchronous Buck Controller

### 1 Features

- Input Voltage Range From 3 V to 20 V
- 600-kHz Switching Frequency
- High- and Low-Side FET  $R_{DS(on)}$  Current Sensing
- Programmable Thermally Compensated OCP Levels
- Programmable Soft-Start
- 600-mV, 1.3% Reference Voltage
- Voltage Feed-Forward Compensation
- Supports Prebiased Output
- Frequency Spread Spectrum
- Thermal Shutdown Protection at 145°C
- 10-Pin 3-mm × 3-mm VSON Package With Ground Connection to Thermal Pad

### 2 Applications

- POL Modules
- Printers
- Digital TVs
- Telecom

### 3 Description

The TPS40345 is a synchronous buck controller that operates from 3-V to 20-V input and which can be used in cost-optimized applications. The controller implements a voltage-mode control architecture with input-voltage feed-forward compensation that responds instantly to a change in input voltage. The switching frequency is fixed at 600 kHz.

The frequency spread spectrum (FSS) feature adds to the switching frequency, significantly reducing the peak EMI noise and making it much easier to comply with EMI standards.

The TPS40345 offers design with a variety of user-programmable functions, including soft-start, overcurrent protection (OCP) levels, and loop compensation.

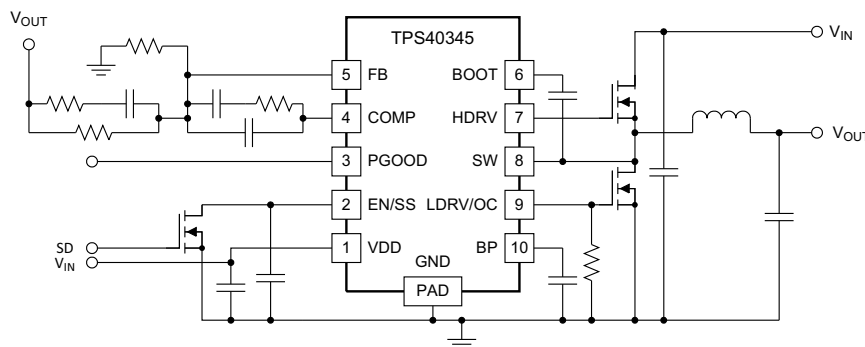

OCP level may be programmed by a single external resistor connected from the LDRV pin to circuit ground. During initial power on, the TPS40345 enters a calibration cycle, measures the voltage at the LDRV pin, and sets an internal OCP voltage level. During operation, the programmed OCP voltage level is compared to the voltage drop across the low-side FET when it is on to determine whether there is an overcurrent condition. The TPS40345 then enters a shutdown and restart cycle until the fault is removed.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS40345	VSON (10)	3.00 mm × 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
BOOT	6	I	Gate drive voltage for the high-side N-channel MOSFET. A 0.1- $\mu$ F capacitor (typical) must be connected between this pin and SW. For low input voltage operation, an external Schottky diode from BP to BOOT is recommended to maximize the gate drive voltage for the high-side.
BP	10	O	Output bypass for the internal regulator. Connect a low ESR bypass ceramic capacitor of 1 $\mu$ F or greater from this pin to GND.
COMP	4	O	Output of the error amplifier and connection node for loop feedback components.
EN/SS	2	I	Logic level input which starts or stops the controller via an external user command. Letting this pin float turns the controller on. Pulling this pin low disables the controller. This is also the soft-start programming pin. A capacitor connected from this pin to GND programs the soft-start time. The capacitor is charged with an internal current source of 10 $\mu$ A. The resulting voltage ramp of this pin is also used as a second non-inverting input to the error amplifier after a 0.8 V (typical) level shift downwards. Output regulation is controlled by the internal level shifted voltage ramp until that voltage reaches the internal reference voltage of 600 mV – the voltage ramp of this pin reaches 1.4 V (typical). Optionally, a 267-k $\Omega$ resistor from this pin to BP enables the FSS feature.
FB	5	I	Inverting input to the error amplifier. In normal operation, the voltage on this pin is equal to the internal reference voltage.
PGOOD	3	O	Open-drain power good output.
HDRV	7	O	Bootstrapped gate drive output for the high-side N-channel MOSFET.
LDRV/OC	9	O	Gate drive output for the low-side synchronous rectifier N-channel MOSFET. A resistor from this pin to GND is also used to determine the voltage level for OCP. An internal current source of 10 $\mu$ A flows through the resistor during initial calibration and that sets up the voltage trip point used for OCP.
VDD	1	I	Power input to the controller. Bypass VDD to GND with a low ESR ceramic capacitor of at least 1 $\mu$ F close to the device.
SW	8	O	Sense line for the adaptive anti-cross conduction circuitry. Serves as common connection for the flying high-side FET driver.
GND	Thermal Pad	—	Ground connection to the controller. This is also the thermal pad used to conduct heat from the device. This connection serves a twofold purpose. The first is to provide an electrical ground connection for the device. The second is to provide a low thermal impedance path from the device die to the PCB. This pad should be tied externally to a ground plane.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
VDD	-0.3	22	V
SW	-3	27	V
SW (< 100 ns pulse width, 10 $\mu$ J)		-5	V
BOOT	-0.3	30	V
HDRV	-5	30	V
BOOT-SW, HDRV-SW (differential from BOOT or HDRV to SW)	-0.3	7	V
COMP, PGOOD, FB, BP, LDRV, EN/SS	-0.3	7	V
Operating junction temperature, T <sub>J</sub>	-40	145	°C
Storage temperature, T <sub>stg</sub>	-55	150	°C

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those included under [Recommended Operating Conditions](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods of time may affect device reliability.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

	MIN	NOM	MAX	UNIT
Input voltage, VDD	3		20	V
Operating junction temperature, T <sub>J</sub>	-20		125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS40345	UNIT
		DRC (VSON)	
		10 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	44.3	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	56.1	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	19.2	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.7	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	19.4	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	5.5	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

 $T_J = -20^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ ,  $V_{DD} = 12\text{ V}$ , all parameters at zero power dissipation (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>VOLTAGE REFERENCE</b>						
$V_{FB}$	FB input voltage	$T_J = 25^{\circ}\text{C}$ , $3\text{ V} < V_{DD} < 20\text{ V}$	597	600	603	mV
		$-20^{\circ}\text{C} < T_J < 125^{\circ}\text{C}$ , $3\text{ V} < V_{DD} < 20\text{ V}$	592	600	608	
<b>INPUT SUPPLY</b>						
$V_{DD}$	Input supply voltage range		3		20	V
$I_{DDSD}$	Shutdown supply current	$V_{EN/SS} < 0.2\text{ V}$		70	100	$\mu\text{A}$
$I_{DDQ}$	Quiescent, nonswitching	Let EN/SS float, $V_{FB} = 1\text{ V}$		2.5	3.5	mA
<b>ENABLE/SOFT-START</b>						
$V_{IH}$	High-level input voltage, EN/SS		0.55	0.7	1	V
$V_{IL}$	Low-level input voltage, EN/SS		0.27	0.3	0.33	V
$I_{SS}$	Soft-start source current		8	10	12	$\mu\text{A}$
$V_{SS}$	Soft-start voltage level		0.4	0.8	1.3	V
<b>BP REGULATOR</b>						
$V_{BP}$	Output voltage	$I_{BP} = 10\text{ mA}$	6.2	6.5	6.8	V
$V_{DO}$	Regulator dropout voltage, $V_{DD} - V_{BP}$	$I_{BP} = 25\text{ mA}$ , $V_{DD} = 3\text{ V}$		70	110	mV
<b>OSCILLATOR</b>						
$f_{SW}$	PWM frequency		540	600	660	kHz
$V_{RAMP}^{(1)}$	Ramp amplitude		$V_{DD}/6.6$	$V_{DD}/6$	$V_{DD}/5.4$	V
$f_{SWFSS}$	Frequency spread-spectrum frequency deviation		12%			$f_{sw}$
$f_{MOD}$	Modulation frequency			25		kHz
<b>PWM</b>						
$D_{MAX}^{(1)}$	Maximum duty cycle	$V_{FB} = 0\text{ V}$ , $3\text{ V} < V_{DD} < 20\text{ V}$	90%			
$t_{ON(min)}^{(1)}$	Minimum controllable pulse width				70	ns
$t_{DEAD}$	Output driver dead time	HDRV off to LDRV on	5	25	35	ns
		LDRV off to HDRV on	5	25	30	
<b>ERROR AMPLIFIER</b>						
$G_{BWP}^{(1)}$	Gain bandwidth product		10	24		MHz
$A_{OL}^{(1)}$	Open loop gain		60			dB
$I_{IB}$	Input bias current (current out of FB pin)	$V_{FB} = 0.6\text{ V}$			75	nA
$I_{EAOP}$	Output source current	$V_{FB} = 0\text{ V}$	2			mA
$I_{EAOM}$	Output sink current	$V_{FB} = 1\text{ V}$	2			
<b>PGOOD</b>						
$V_{OV}$	Feedback upper voltage limit for PGOOD		655	675	700	mV
$V_{UV}$	Feedback lower voltage limit for PGOOD		500	525	550	
$V_{PGD-HYST}$	PGOOD hysteresis voltage at FB			25	40	
$R_{PGD}$	PGOOD pulldown resistance	$V_{FB} = 0\text{ V}$ , $I_{FB} = 5\text{ mA}$		30	70	$\Omega$
$I_{PGDLK}$	PGOOD leakage current	$550\text{ mV} < V_{FB} < 655\text{ mV}$ , $V_{PGOOD} = 5\text{ V}$		10	20	$\mu\text{A}$

(1) Ensured by design. Not production tested.

**Electrical Characteristics (continued)**
 $T_J = -20^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ ,  $V_{DD} = 12\text{ V}$ , all parameters at zero power dissipation (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

## 7 Detailed Description

### 7.1 Overview

The TPS40345 is a cost-optimized synchronous buck controller providing high-end features to construct high-performance DC–DC converters. Prebias capability eliminates concerns about damaging sensitive loads during start-up. Programmable overcurrent protection levels and hiccup overcurrent fault recovery maximize design flexibility and minimize power dissipation in the event of a prolonged output short. The frequency spread spectrum (FSS) feature reduces peak EMI noise by spreading the initial energy of each harmonic along a frequency band, thus giving a wider spectrum with lower amplitudes.

### 7.2 Functional Block Diagram

Copyright © 2017, Texas Instruments Incorporated

### 7.3 Feature Description

#### 7.3.1 Voltage Reference

The 600-mV bandgap cell is internally connected to the noninverting input of the error amplifier. The reference voltage is trimmed with the error amplifier in a unity gain configuration to remove amplifier offset from the final regulation voltage. The 1.3% tolerance on the reference voltage allows the user to design a very accurate power supply.

## Feature Description (continued)

### 7.3.2 Enable Functionality, Start-Up Sequence and Timing

After input power is applied, an internal current source of 40  $\mu\text{A}$  starts to charge up the soft-start capacitor connected from EN/SS to GND. When the voltage across that capacitor increases to 0.7 V, it enables the internal BP regulator followed by a calibration. The total calibration time is about 1.9 ms. See Figure 11. During the calibration, the device performs in the following way. It disables the LDRV drive and injects an internal 10- $\mu\text{A}$  current source to the resistor connected from LDRV to GND. The voltage developed across that resistor is then sampled and latched internally as the OCP trip level until one cycles the input or toggles the EN/SS.

**Figure 11. Start-Up Sequence and Timing**

The voltage at EN/SS is internally clamped to 1.3 V before and/or during calibration to minimize the discharging time once calibration. The discharging current is from an internal current source of 140  $\mu\text{A}$  and it pulls the voltage down to 0.4 V. The discharging current then initiates the soft-start by charging up the capacitor using an internal current source of 10  $\mu\text{A}$ . The resulting voltage ramp on this pin is used as a second noninverting input to the error amplifier after an 800 mV (typical) downward level-shift; therefore, actual soft-start does not occur until the voltage at this pin reaches 800 mV.

If EN/SS is left floating, the controller starts automatically. EN/SS must be pulled down to less than 270 mV to ensure that the chip is in shutdown mode.

### 7.3.3 Soft-Start Time

The soft-start time of the TPS40345 is user programmable by selecting a single capacitor. The EN/SS pin sources 10  $\mu\text{A}$  to charge this capacitor. The actual output ramp-up time is the amount of time that it takes for the 10  $\mu\text{A}$  to charge the capacitor through a 600-mV range. There is some initial lag due to calibration and an offset (800 mV) from the actual EN/SS pin voltage to the voltage applied to the error amplifier.

The soft-start is done in a closed-loop fashion, meaning that the error amplifier controls the output voltage at all times during the soft-start period and the feedback loop is never open as occurs in duty cycle limit soft-start schemes. The error amplifier has two non-inverting inputs, one connected to the 600-mV reference voltage, and the other connected to the offset EN/SS pin voltage. The lower of these two voltages is what the error amplifier controls the FB pin. As the voltage on the EN/SS pin ramps up past approximately 1.4 V (800-mV offset voltage plus the 600 mV reference voltage), the 600-mV reference voltage becomes the dominant input and the converter has reached its final regulation voltage.

The capacitor required for a given soft-start ramp time for the output voltage is given by Equation 1.

$$C_{SS} = \left( \frac{I_{SS}}{V_{FB}} \right) \times t_{SS}$$

## Feature Description (continued)

where

- $C_{SS}$  is the required capacitance on the EN/SS pin. (F)
  - $I_{SS}$  is the soft-start source current (10  $\mu$ A).
  - $V_{FB}$  is the feedback reference voltage (0.6 V).
  - $t_{SS}$  is the desired soft-start ramp time (s).
- (1)

### 7.3.4 Oscillator and Frequency Spread Spectrum (FSS)

The oscillator frequency is internally fixed. The TPS40345 operating frequency is 600 kHz.

Connecting a resistor with a value of 267 k $\Omega$   $\pm$ 10% from BP to EN/SS enables the FSS feature. When the FSS is enabled, it spreads the internal oscillator frequency over a minimum 12% window using a 25-kHz modulation frequency with triangular profile. By modulating the switching frequency, side-bands are created. The emission power of the fundamental switching frequency and its harmonics is distributed into smaller pieces scattered around many sideband frequencies. The effect significantly reduces the peak EMI noise and makes it much easier for the resultant emission spectrum to pass EMI regulations.

### 7.3.5 Overcurrent Protection

Programmable OCP level at LDRV is from 6 mV to 150 mV at room temperature with 3000 ppm temperature coefficient to help compensate for changes in the low-side FET channel resistance as temperature increases. With a scale factor of 2, the actual trip point across the low-side FET is in the range of 12 mV to 300 mV. The accuracy of the internal current source is  $\pm$ 5%. Overall offset voltage, including the offset voltage of the internal comparator and the amplifier for scale factor of 2, is limited to  $\pm$ 8 mV.

Maximum clamp voltage at LDRV is 340 mV to avoid turning on the low-side FET during calibration and in a prebiased condition. The maximum clamp voltage is fixed and it does not change with temperature. If the voltage drop across  $R_{OCSET}$  reaches the 340-mV maximum clamp voltage during calibration (no  $R_{OCSET}$  resistor included), it disables OC protection. Once disabled, there is no low-side or high-side current sensing.

OCP level at HDRV is fixed at 450 mV with 3000-ppm temperature coefficient to help compensate for changes in the high-side FET channel resistance as temperature increases. OCP at HDRV provides pulse-by-pulse current limiting.

OCP sensing at LDRV is a true inductor valley current detection, using sample and hold. [Equation 2](#) can be used to calculate  $R_{OCSET}$ :

$$R_{OCSET} = \left( \frac{\left( I_{OUT(max)} - \left( \frac{I_{P-P}}{2} \right) \right) \times R_{DS(on)} - V_{OCLOS}}{2 \times I_{OCSET}} \right)$$

where

- $I_{OCSET}$  is the internal current source.
  - $V_{OCLOS}$  is the overall offset voltage.
  - $I_{P-P}$  is the peak-to-peak inductor current.
  - $R_{DS(on)}$  is the drain to source ON-resistance of the low-side FET.
  - $I_{OUT(max)}$  is the trip point for OCP.
  - $R_{OCSET}$  is the resistor used for setting the OCP level.
- (2)

To avoid overcurrent tripping in normal operating load range, calculate  $R_{OCSET}$  using [Equation 2](#) with:

- The maximum  $R_{DS(ON)}$  at room temperature
- The lower limit of  $V_{OCLOS}$  (–8 mV) and the lower limit of  $I_{OCSET}$  (9.5  $\mu$ A) from the *Electrical Characteristics* table.
- The peak-to-peak inductor current  $I_{P-P}$  at minimum input voltage

## Feature Description (continued)

Overcurrent is sensed across both the low-side FET and the high-side FET. If the voltage drop across either FET exceeds the OC threshold, a count increments one count. If no OC is detected on either FET, the fault counter decrements by one count. If three OC pulses are summed, a fault condition is declared which cycles the soft-start function in a hiccup mode. Hiccup mode consists of four dummy soft-start timeouts followed by a real one if overcurrent condition is encountered during normal operation, or five dummy soft-start timeouts followed by a real one if overcurrent condition occurs from the beginning during start. This cycle continues indefinitely until the fault condition is removed.

### 7.3.6 Drivers

The drivers for the external high-side and low-side MOSFETs can drive a gate-to-source voltage of  $V_{BP}$ . The LDRV driver for the low-side MOSFET switches between BP and GND, while the HDRV driver for the high-side MOSFET is referenced to SW and switches between BOOT and SW. The drivers have nonoverlapping timing that is governed by an adaptive delay circuit to minimize body diode conduction in the synchronous rectifier.

### 7.3.7 Prebias Start-Up

The TPS40345 contains a circuit to prevent current from being pulled from the output during start-up in the condition the output is prebiased. There are no PWM pulses until the internal soft-start voltage rises above the error amplifier input (FB pin), if the output is prebiased. Once the soft-start voltage exceeds the error amplifier input, the controller slowly initiates synchronous rectification by starting the synchronous rectifier with a narrow on time. The controller then increments that on time on a cycle-by-cycle basis until it coincides with the time dictated by  $(1-D)$ , where D is the duty cycle of the converter. This approach prevents the sinking of current from a prebiased output, and ensures the output voltage start-up and ramp to regulation is smooth and controlled.

### 7.3.8 Power Good

The TPS40345 provides an indication that output is good for the converter. This is an open-drain signal and pulls low when any condition exists that would indicate that the output of the supply might be out of regulation. These conditions include the following:

- $V_{FB}$  is more than  $\pm 12.5\%$  from nominal.
- Soft-start is active.
- A short-circuit condition has been detected.

---

#### NOTE

When there is no power to the device, PGOOD is not able to pull close to GND if an auxiliary supply is used for the power good indication. In this case, a built-in resistor connected from drain to gate on the PGOOD pulldown device makes the PGOOD pin look approximately like a diode to GND.

---

### 7.3.9 Thermal Shutdown

If the junction temperature of the device reaches the thermal shutdown limit of  $145^{\circ}\text{C}$ , the PWM and the oscillator are turned off and HDRV and LDRV are driven low. When the junction cools to the required level ( $125^{\circ}\text{C}$  typical), the PWM initiates soft-start as during a normal power-up cycle.

## 7.4 Device Functional Modes

### 7.4.1 Modes of Operation

#### 7.4.1.1 UVLO

In UVLO, VDD is less than UVLO\_ON, the BP6 regulator is off, and the HDRV and LDRV are held low by internal passive discharge resistors.

#### 7.4.1.2 Disable

Disable is forced by holding SS/EN below 0.4 V. In disable, the BP6 regulator is off, and both HDRV and LDRV are held low by passive discharge resistors.

## Device Functional Modes (continued)

### 7.4.1.3 Calibration

Each enable of the TPS40345 device requires a calibration which lasts approximately 2 ms. During calibration the TPS40345 device LDRV and HDRV are held off by its pulldown drivers while the device configures as detailed in [Enable Functionality, Start-Up Sequence and Timing](#).

### 7.4.1.4 Converting

When calibration completes, the TPS40345 ramps its reference voltage as described in [Soft-Start Time](#), and the states of the LDRV and HDRV drivers are dictated by the COMP pin to regulate the FB pin equal to the internal reference.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS40345 is a cost-optimized synchronous buck controllers providing high-end features to construct high-performance DC-DC converters. Prebias capability eliminates concerns about damaging sensitive loads during start-up. Programmable overcurrent protection levels and hiccup overcurrent fault recovery maximize design flexibility and minimize power dissipation in the event of a prolonged output short. Frequency spread spectrum (FSS) feature reduces peak EMI noise by spreading the initial energy of each harmonic along a frequency band, thus giving a wider spectrum with lower amplitudes.

### 8.2 Typical Applications

For this 20-A, 12-V to 1.2-V design, the 600-kHz TPS40345 was selected for a balance between small size and high efficiency.

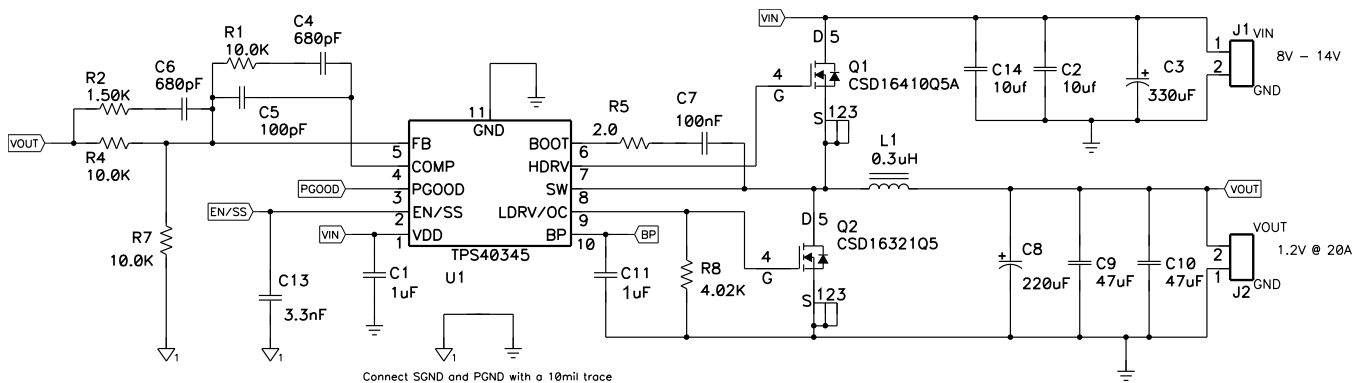

Figure 12. TPS40345 Design Example Schematic

## Typical Applications (continued)

### 8.2.1 Design Requirements

For this example, follow the design parameters listed in [Table 1](#).

**Table 1. Design Example Electrical Characteristics**

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>IN</sub>	Input voltage		8		14	V
V <sub>INripple</sub>	Input ripple	I <sub>OUT</sub> = 20 A			0.5	V
V <sub>OUT</sub>	Output voltage	0 A ≤ I <sub>OUT</sub> ≤ 20 A	1.164	1.2	1.236	V
	Line regulation	8 V ≤ V <sub>IN</sub> ≤ 14 V			0.5%	
	Load regulation	0 A ≤ I <sub>OUT</sub> ≤ 20 A			0.5%	
V <sub>RIPPLE</sub>	Output ripple	I <sub>OUT</sub> = 20 A			36	mV

	Size				1.5	in <sup>2</sup>

### 8.2.2 Detailed Design Procedure

#### 8.2.2.1 Selecting the Switching Frequency

To achieve the small size for this design the TPS40345, with  $f_{SW} = 600$  kHz, is selected for minimal external component size.

#### 8.2.2.2 Inductor Selection (L1)

Synchronous buck power inductors are typically sized for approximately 30% peak-to-peak ripple current (I<sub>RIPPLE</sub>).

Given this target ripple current, the required inductor size can be calculated in [Equation 3](#).

$$L \approx \frac{V_{IN(max)} - V_{OUT}}{0.3 \times I_{OUT}} \times \frac{V_{OUT}}{V_{IN(max)}} \times \frac{1}{F_{SW}} = \frac{14V - 1.2V}{0.3 \times 20A} \times \frac{1.2V}{14V} \times \frac{1}{600kHz} = 305nH \quad (3)$$

Selecting a standard 300-nH inductor value, solve for I<sub>RIPPLE</sub> = 6 A

The RMS current through the inductor is approximated by [Equation 4](#).

$$I_{Lrms} = \sqrt{I_{Lavg}^2 + \frac{1}{12} I_{RIPPLE}^2} = \sqrt{I_{OUT}^2 + \frac{1}{12} I_{RIPPLE}^2} = \sqrt{20^2 + \frac{1}{12} 6^2} = 20.07 A \quad (4)$$

#### 8.2.2.3 Output Capacitor Selection (C12)

The selection of the output capacitor is typically driven by the output transient response. [Equation 5](#) and [Equation 6](#) overestimate the voltage deviation to account for delays in the loop bandwidth and can be used to determine the required output capacitance.

$$V_{OVER} < \frac{I_{TRAN}}{C_{OUT}} \times \Delta T = \frac{I_{TRAN}}{C_{OUT}} \times \frac{I_{TRAN} \times L}{V_{OUT}} = \frac{I_{TRAN}^2 \times L}{V_{OUT} \times C_{OUT}} \quad (5)$$

$$V_{UNDER} < \frac{I_{TRAN}}{C_{OUT}} \times \Delta T = \frac{I_{TRAN}}{C_{OUT}} \times \frac{I_{TRAN} \times L}{V_{IN} - V_{OUT}} = \frac{I_{TRAN}^2 \times L}{(V_{IN} - V_{OUT}) \times C_{OUT}} \quad (6)$$

If  $V_{IN(min)} > 2 \times V_{OUT}$ , use overshoot ([Equation 5](#)) to calculate minimum output capacitance. If  $V_{IN(min)} < 2 \times V_{OUT}$ , use undershoot ([Equation 6](#)) to calculate minimum output capacitance.

$$C_{OUT(MIN)} = \frac{I_{TRAN(MAX)}^2 \times L}{(V_{OUT}) \times V_{OVER}} = \frac{10^2 \times 300nH}{1.2 \times 100mV} = 250\mu F \quad (7)$$

With a minimum capacitance, the maximum allowable ESR is determined by the maximum ripple voltage and is approximated by [Equation 8](#).

$$ESR_{max} = \frac{V_{RIPPLE(Total)} - V_{RIPPLE(CAP)}}{I_{RIPPLE}} = \frac{V_{RIPPLE(total)} - \left( \frac{I_{RIPPLE}}{8 \times C_{OUT} \times F_{SW}} \right)}{I_{RIPPLE}} = \frac{36mV - \left( \frac{6A}{8 \times 250\mu F \times 600kHz} \right)}{6A} = 5.2m\Omega \quad (8)$$

Two 47- $\mu$ F and one 220- $\mu$ F capacitors are selected to provide more than 250  $\mu$ F of minimum capacitance and 5.2 m $\Omega$  of ESR.

#### 8.2.2.4 Peak Current Rating of Inductor

With output capacitance, it is possible to calculate the charge current during start-up and determine the minimum saturation current rating for the inductor. The start-up charging current is approximated by [Equation 9](#).

$$I_{CHARGE} = \frac{V_{OUT} \times C_{OUT}}{T_{SS}} = \frac{1.2V(2 \times 47\mu F + 220\mu F)}{1.5ms} = 0.251A \quad (9)$$

$$I_{L\_PEAK} = I_{OUT(max)} + \frac{1}{2} I_{RIPPLE} + I_{CHARGE} = 20A + \frac{1}{2} \times 6A + 0.2512A = 23.25A \quad (10)$$

**Table 2. Inductor Requirements**

PARAMETER		VALUE	UNIT
L	Inductance	300	nH
$I_{L(rms)}$	RMS current (thermal rating)	20.07	A
$I_{L(peak)}$	Peak current (saturation rating)	23.25	A

#### 8.2.2.5 Input Capacitor Selection (C8)

The input voltage ripple is divided between capacitance and ESR. For this design  $V_{RIPPLE(cap)} = 150$  mV and  $V_{RIPPLE(esr)} = 150$  mV. The minimum capacitance and maximum ESR are estimated by [Equation 11](#).

$$C_{IN(min)} = \frac{I_{LOAD} \times V_{OUT}}{V_{RIPPLE(CAP)} \times V_{IN} \times F_{SW}} = \frac{20 \times 1.2V}{150mV \times 8V \times 600kHz} = 33.3\mu F \quad (11)$$

$$ESR_{MAX} = \frac{V_{RIPPLE(ESR)}}{I_{LOAD} + \frac{1}{2} I_{RIPPLE}} = \frac{150mV}{23A} = 6.5m\Omega \quad (12)$$

The RMS current in the input capacitors is estimated by [Equation 13](#).

$$I_{RMS\_CIN} = I_{LOAD} \times \sqrt{D \times (1-D)} = 20A \times \sqrt{0.15 \times (1-0.15)} = 7.14 Arms \quad (13)$$

Three 1210, 10- $\mu$ F, 25-V, X5R ceramic capacitors are selected. Higher voltage capacitors are selected to minimize capacitance loss at the DC bias voltage to ensure the capacitors allow sufficient capacitance at the working voltage.

#### 8.2.2.6 MOSFET Switch Selection (Q1 and Q2)

Reviewing available TI NexFET MOSFETs using the TI NexFET MOSFET selection tool, the CSD16410Q5A and CSD16321Q5 5-mm  $\times$  6-mm MOSFETs are selected.

These two FETs have maximum total gate charges of 5 nC and 10 nC, respectively.

#### 8.2.2.7 Bootstrap Capacitor (C6)

To ensure proper charging of the high-side FET gate, limit the ripple voltage on the boost capacitor to less than 50 mV.

$$C_{Boost} = 20 \times Q_{G1} = 20 \times 5nC = 100nF \quad (14)$$

### 8.2.2.8 VDD Bypass Capacitor (C7)

Per this TPS40345 data sheet, select a 1- $\mu$ F X5R or better ceramic bypass capacitor for VDD.

### 8.2.2.9 BP Bypass Capacitor (C5)

Per the TPS40345 data sheet, a minimum 1- $\mu$ F ceramic capacitance is required to stabilize the BP regulator. To limit regulator noise to less than 10 mV, the value of the bypass capacitor is calculated in [Equation 15](#).

$$C_{BP} = 100 \times \text{MAX}(Q_{G1}, Q_{G2}) \quad (15)$$

Because Q2 is larger than Q1, and the total gate charge of Q2 is 10 nC, a BP capacitor of 1  $\mu$ F is calculated. A standard value of 1  $\mu$ F is selected to limit noise on the BP regulator.

### 8.2.2.10 Short-Circuit Protection (R11)

The TPS40345 uses the negative drop across the low-side FET at the end of the OFF-time to measure the inductor current. Allowing for 30% over maximum load and 20% rise in  $R_{DS(on)Q1}$  for self-heating, the voltage drop across the low-side FET at current limit is given by [Equation 16](#).

$$V_{OC} = (1.3 \times I_{LOAD} - \frac{1}{2} I_{ripple}) \times 1.2 \times R_{DS(on)Q2} = (1.3 \times 20 \text{ A} - \frac{1}{2} 6 \text{ A}) \times 1.2 \times 4.6 \text{ m}\Omega = 127 \text{ mV} \quad (16)$$

The TPS40345 internal temperature coefficient helps compensate for the MOSFET's  $R_{DS(on)}$  temperature coefficient, so the current limit programming resistor is selected by [Equation 17](#).

$$R_{CS} = \frac{V_{OC} - V_{OCLOS(min)}}{2 \times I_{OCSET(min)}} = \frac{127 \text{ mV} - (-8 \text{ mV})}{2 \times 9.5 \mu\text{A}} = 7.1 \text{ k}\Omega \quad (17)$$

### 8.2.2.11 Feedback Divider (R4, R5)

The TPS40345 controller uses a full operational amplifier with an internally fixed 0.6-V reference. R4 is selected between 10 k $\Omega$  and 50 k $\Omega$  for a balance of feedback current and noise immunity. With R4 set to 10 k $\Omega$ , The output voltage is programmed with a resistor divider given by [Equation 18](#).

$$R7 = \frac{V_{FB} \times R4}{V_{OUT} - V_{FB}} = \frac{0.600 \text{ V} \times 10.0 \text{ k}\Omega}{1.2 \text{ V} - 0.600 \text{ V}} = 10 \text{ k}\Omega \quad (18)$$

### 8.2.2.12 Compensation: (C2, C3, C4, R3, R6)

Using the TPS40k Loop Stability Tool for 100-kHz bandwidth and 60° phase margin with a R4 value of 10.0 k $\Omega$ , the following values are returned.

- C4 = 680 pF
- C5 = 100 pF
- C6 = 680 pF
- R1 = 10 k $\Omega$
- R2 = 1.5 k $\Omega$

### 8.2.3 Application Curves

## 9 Power Supply Recommendations

The TPS40345 device is designed to operate from an input voltage supply between 3 V and 20 V. This input supply must remain within the input voltage supply range. This supply must be well regulated.

## 10 Layout

### 10.1 Layout Guidelines

- For MOSFET or power block layout, follow the layout recommendations provided for the MOSFET or power block selected.
- Connect VDD to VIN as close as possible to the drain connection of the high-side FET to avoid introducing additional drop, which could trigger short-circuit protection.
- Place VDD and BP to GND capacitors within 2 mm of the device and connected to the thermal pad (GND).
- Connect the FB to GND resistor to the thermal tab (GND) with a minimum 10-mil wide trace.
- Place VOUT to FB resistor within 2 mm of the FB pin.
- Connect the EN/SS-to-GND capacitor to the thermal tab (GND) with a minimum 10-mil-wide trace. It may share this trace with FB to GND.
- If a BJT or MOSFET is used to disable EN/SS, place it within 5 mm of the device.
- If a COMP to GND resistor is used, place it within 5 mm of the device.
- All COMP and FB traces should be kept minimum line width and as short as possible to minimize noise coupling.
- EN/SS should not be routed more than 20 mm from the device.
- If multiple layers are used, extend GND under all components connected to FB, COMP and EN/SS to reduce noise sensitivity.
- HDRV and LDRV must provide short, low inductance paths of 5 mm or less to the gates of the MOSFETs or power block.
- Place no more than 1  $\Omega$  of resistance between HDRV or LDRV and their MOSFET or power block gate pins.
- LDRV / OC to GND current limit programming resistor may be placed on the far side of the MOSFET if necessary to ensure a short connection from LDRV to the gate of the low-side MOSFET.
- Place the BOOT to SW resistor and capacitor within 4 mm of the device using a minimum of 10-mil-wide trace. The full width of the component pads are preferred for trace widths if design rules allow.
- If via must be used between the HDRV, SW and LDRV pins and their respective MOSFET or power block connections, use a minimum of two vias to reduce parasitic inductance
- Refer to the land pattern data for the preferred layout of thermal vias within the thermal pad.
- TI recommends extending the top-layer copper area of the thermal pad (GND) beyond the package a minimum 3 mm between pins 1 and 10 and 5 and 6 to improve thermal resistance to ambient of the device.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS40345DRCR	ACTIVE	VSON	DRC	10	3000	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-20 to 85	0345	<a href="#">Samples</a>
TPS40345DRCT	ACTIVE	VSON	DRC	10	250	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-20 to 85	0345	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
